New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain,

a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The domains and cysteine-rich domains of dystrophin or utrophin genes. The dominis and cysteine-rich domains of dystrophin or utrophin genes. The comprising dystrophin minigene operably linked to a expression control element, in a recombinant adeno-associated virus or retrovirus is control element, in a mammalian destrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin minigene delta4173 containing nucleotides 1:1992 (N-terminus, hinge H1 and rods R1, R2 and R3), 8059-10227 (rods R22, R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids). repeats, H1 and H4 domains and a cysteine rich domain of Example 1; Page 43-44; 71pp; English. rod repeats, Hl an dystrophin gene ·

```

The present invention relates to an isolated nucleotide sequence encoding of a dystrophin minigene. The minigene comprises N-terminal or modified domains and cystaine-rich domains, utrophin or a spectrin gene, HI and H4 commissing dystrophin minigene operably linked to an expression corrol element, in a recombinant adeno-associated virus (AAV)

CC control element, in a recombinant adeno-associated virus or retrovirus is control element, in a recombinant adeno-associated virus or retrovirus is dystrophy (BMD) in a mammalian subject. The present sequence is human cystrophy (BMD) in a mammalian subject. The present sequence is human and cods RI and R2), 8059-10227 (rods R22, R33 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).

Sequence 3999 BP; 1223 A; 907 C; 933 G; 936 T; 0 other;

RESULT 3

```
The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 and the main and the comprise of dystrophin or utrophin genes. The comprising dystrophin minigene operably. Linked to an expression control invention also relates to a recombinant adeas of the according to a recombinant control comprising dystrophin minigene in operably linked with an expression control element. The dystrophin minigene in operably linkage with an expression control element in a recombinant adosonassociated virus or retrovirus is useful for treating buchenne muscular dystrophy (BWD) in a mammalian subject. The present sequence is AAV exprophy (BWD) in a mammalian subject. The present sequence is AAV evector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1897 CCAGTTCATACTCATGAGGGTACATGATGATTTCACAGCCCATCAGGCCCGGGTTGG 1956

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 of N-terminal domains, rod repeats, utrophin or atrophin gene, The domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is control element, in a recombinant adeno-associated virus or retrovirus dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a vector plasmid construct containing human dystrophin minigenes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2221 GCCTCTTGGACCTGATCTTGAAGACCTAAAACGCCAAGTACAACAACATAAGGTGCTTCA 2280

```

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV)

```
comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Backer muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin minigene delta3849 containing nucleotides 1-1668 (N-terminus, and CR domain) and 11047-11058 (dystrophin last 3 amino acids).

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 Gomains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) invention also relates to a recombinant adeno-associated virus (AAV) invention also relates to a recombinant adeno-associated virus or extression comprising dystrophin minigene in operable linkage with an expression element. The dystrophin minigene in operable linkage with an expression useful for treating buchenne muscular dystrophy (BMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a muscle vector plasmid construct containing human dystrophin minigenes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, or cod repeats, HI and H4 domains and a cysteine rich domain of a

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 domains and cystelne-rich domains of dystrophin or utrophin genes. The domains and cystelne-rich domains of dystrophin or utrophin or utrophin genes. The comprising dystrophin minigene operably linked to an expression control comprising dystrophin minigene in operable linked to an expression control control lement, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV dystrophy (BMD) in a mammalian subject. The present sequence is AAV coetor plasmid construct containing human dystrophin minigenes, a cytomegalovirus (CMV) promoter and a small polyA signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2040 AACTGAAGTACAAGAGGAGATGAATCTCCTAAATTCAAGATGGGAATGCCTCAGGGTAGC 2099

```
The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H and H4 domains and cysteine-rich domains of dystrophin or utrophin gene, H and H4 comprising dystrophin minigene operably linked to an expression control celement. The dystrophin minigene in operable linkage with an expression control useful for treating Duchenne Muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammanian subject. The present sequence is AAV creatine kinase (MCK) promoter and a small polyA signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                        ó
New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, repeats, H1 and H4 domains and a cysteine rich domain of a

The present invention relates to an isolated nucleotide sequence encoding a dystrophin miniqene. The miniqene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin miniqene operably linked to an expression control

element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin minigene delta347 containing nucleotides 1-1992 (N·terminus, hinge HI and rods RI, R2 and R3), 8749-10227 (rod R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).

New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a

Example 1; Page 45; 71pp; English.

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N terminal or modified N terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 invention also relates to domains of dystrophin or utrophin genes. The Comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (DMD) in a mammalian subject. The present sequence is human dystrophin DNA fragment encoding N-terminus, hinge HI and rods RI, R2

Sequence 1991 BP; 680 A; 393 C; 442 G; 476 T; 0 other;

                                                                                                           Qλ
                                                                                                                                               ДQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified a dystrophin minigene. The minigene comprises N-terminal or modified domains, rod repeats, utrophin or a spectrin gene, H and H4 N-terminal domains, rod repeats, utrophin or utrophin genes. The domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adency associated virus (AAV) invention also relates to a recombinant in noperable linkage with an expression control element. The dystrophin minigene in operable linkage with an expression useful for treating Duchenne muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin DNA fragment encoding rods R22, R23 and R24, hinge H4 and

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N.terminal or modified domains and constant demains, rod repeats, utrophin or a spectrin gene, H1 and H4 invention also relates to a recombinant adeno-associated virus (AAV) element. The dystrophin minigene operably linked to an expression control comprol element, The dystrophin minigene in operable linkage with an expression useful for treating Duchenne muscular dystrophy (BMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is human hinge H1 and rod R1), 8059-10227 (rods R22, R23 and R24, hinge H4 and cR domain) and ll047-11058 (dystrophin last 3 amino acids).
                                                                                                                                       New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a

N-terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operable linked to an expression control element. The dystrophin minigene in operable linkage with an expression control useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (DMD) in a mammalian subject. The present sequence is AAV dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophy minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1703 CAGGCTGAGGAGGTCAATACTGAGTGGGAAAATTGAACCTGCACTCCGCTGACTGGCAG 1762

The invention provides a gene for the treatment of muscular dystrophy having at least one rod repeat structure of hinge 1, hinge 4 and rod domain of dystrophin gene and having a base sequence of 4.5 kb. The gene and a gene-introducing medium consisting of an adeno-associated virus and a gene-introducing medium consisting of an adeno-associated virus (AAV) vector or lentivirus vector containing the rod shortened dystrophin genes can be used for the genetic treatment of muscular dystrophy of low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 TGAAGTAAACCTGGACCGTTATCAAACAGCTTTAGAAGAAGTATTATCGTGGCTTCTTC 120

The inventors claim an MD probe comprising a purified ss NA SQ which hybridises to at least a part of the MD gene; pure dystrophin (DS) polypeptide, purified NA encoding DS and antibodies (Ab) to DS. The probes are equal to or greater than 10b of one of 12 cDNA sequences deposited as ATCC 58666-57677. The MD gene is human, or a murine Dmd
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 TGAAGTAAACCTGGACCGTTATCAAACAGCTTTAGAAGAAGTATTATGGTGGGTTCTTTC 120

Consortium/LIND at: http://image.llnl.gov
Series: IRAK plate: 23 Row: j Column: 4
This clone was selected for full length sequencing because it
passed the following selection criteria: Hexamer frequency ORF
analysis, Similarity but not identity to protein
This clone has the following problem: incomplete processing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /tissue_type="Mammary tumor. The sequence contained an oligo-dT track that was present in the oligonuclectide that was used to prime the synthesis of first tail. The sequence tag present in the cDNA backen the Notified poly A and the oligo-dT track served to identify it as a clone from the normalized rat placenta pool library CDNA Library Preparation. W.B. Research Genetics (www.resgen.com) The following repetitive elements were found in this CDNA sequence: 1-21,

(EXCEPTION: The aorta pool does not contain emulyouic day 17 RNA and the placenta pool contains only the three embryonic stages). Each library was normalized embryonic stages. Each library was normalized by individually according to the procedure described by anomalo, 1996, 1996. For construction of the DKO subtracted libraries (Genome Research Genome 6: 791-806, 1996). For construction of the procedure described by tagged normalized libraries was mixed in the proportions specified above and electroporated into competent bacteria for production of single-stranded circular DNA representing the pool of libraries. Single-stranded circular DNA representing these five normalized libraries circular DNA representing these five normalized libraries with a driver (PCR amplified inserts from a plasmid DNA with a driver (PCR amplified inserts from a plasmid DNA temptate preparation) comprising: a) a set of about 1,000 arrayed clones from each of the five nor-normalized libraries of brain (CTOS), heart (CSOS). Kidney (CUOS), libraries of brain (CTOS), heart (CSOS). Kidney (CUOS) approximately 5,000 clones represented about 33.3% of the final driver population. A set of about 2,000 arrayed clones from each of the five normalized libraries of brain (CTOS), heart (CSOS), and placenta (CXOS). The resulting pool of a placenta (CXOS). The resulting pool of a placenta (CXOS). The final driver population.
                                                                                                                                                                                                                                                                                      /idu_incst_ units (line identical) with a modified force="Vector: pT73D-pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-DKO polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-DKO polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-DKO polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-DKO polylinger of two mixture of five individually tagged normalized rat libraries: hart-nRAP (20%), heart-nRAP (20%), heart-nRAP (20%), and placenta-nRAP (20%). Each original actra-nRAP (20%), and placenta emixture of equal amounts of library was constructed from a mixture of equal amounts of library was constructed from a mixture of equal amounts of embryonic day 17, adult day 19, embryonic day 21, adult day 12, adult day 75, and adult day 200. Exception: the actra pool does not contain embryonic contain embryonic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     497 CTTGAAGACCTAAAACGCCAAGTACAACATAAGGTGCTTCAAGAAGATCTAGAACAA 556

Carninci,P., Shibata,Y., Hayatsu,N., Sugahara,Y., Shibata,K., Itoh,M., Konno,H., Okazaki,Y., Muramatsu,M. and Hayashizaki,Y. Normalization and Subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes Genome Res. 10 (10), 1617-1630 (2000)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mus musculus adult retina cDNA, RIKEN full-length enriched library, clone:A930021A21:utrophin, full insert sequence.
Site_2: Smal; A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  707 CITITACAAGACAICCITCICAAAIGGCAACGICIIACIGAAGAACAGIGCCITITIAGI 766

Laboratory Mouse DNA Resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynuclocided kinase. Adaptor oligoucleotides were adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114pl/AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors
